

Applied Global Technologies (AGT) is an award-winning innovator of communication technologies and solutions. When the AGT needed to find a way to bring large amounts of power out into the field they found ATC. AGT had a very specific, complex design to fully provide the resources they needed to power their equipment out on the worksite. The trailer would need to support the weight, handle the control panels, and have the proper wiring to fully use the power that they were able to produce. After the design was complete, they were able to fit two 20kw generators with proper ventilation and gas supplies into the trailer. Once the trailers were completed, AGT installed the custom generators and all of their custom communications equipment into the specially designed trailer. The complex installation work needed for these large generators and state of the art communications equipment was a new challenge for both companies but together we were able to provide them with the best solution to fit their need.
